Adopted Projects List 2025

1	Tohoku University	Katsumi Sato	Business Viability of Utilizing Digital Archives of Local Resources
2	Tohoku University	Osamu Murao	Creating a New Market for Disaster Education through Hero-Based Content and Developing a Sustainable Business Model
3	Tohoku University of Art & Design	Yoshiki Seki	Conservation, restoration and inheritance of art collections
4	Niigata University	Zen Koike	Complementing Cancer Care Through Peer Support :A Digital Application for AYA Patients and Families in the Critical "First Month"from Diagnosis to Treatment
5	Iwate Prefectural University	Mizuho Okada	Supporting Newly Nurse Training with Skill Visualization
6	Fukushima Medical University	Miwako Kato Homma	Breakthrough in Predicting Cancer Recurrence
7	Tohoku University	Yuichi Negishi	Commercialization verification of highly active ~ 1nm platinum cluster fuel cell electrode catalyst
8	Tohoku University	Yasuki Okuno	Development of Three-Dimensional Dosimetry Technology for Standardization of Radiation Resistance Evaluation of Large Components
9	Tohoku University	Tomonori Nochi	Promoting Healthy Calf Development through Microbiota Improvement
10	Tohoku University	Emiko Sato	Development of functional food for feline kidney disease containing a combination of lactoferrin and nicotinamide
11	Tohoku University	Yusuke Sekiguchi	Personalized DX for Independent Mobility in Gait Disorder
12	Tohoku University	Guang Hong	Establishment and global sprite of clinical skill OnDemand education system using interactive VR technology
13	Tohoku University	Taku Nakai	Development of an Anti-Diabetic Hypoxic Room
14	Tohoku University	Kenji Kikuchi	Medical Applications of a Biomimetic Puncture-Assist System for Minimally Invasive Therapies
15	Tohoku University	Yoshiro Saito	Feasibility study for the commercialization of a male infertility treatment system based on comprehensive trace element analysis
16	Tohoku University	Hiroshi Hoshijima	Development of robotic anesthesia with AI
17	Tohoku University	Mao Fukuyama	Development of a Microplatform for Body Fluid Analysis
18	Tohoku University	Masanori Shigeno	FABP-Targeted Therapeutics for the Treatment of Multiple Sclerosis
19	Tohoku University	Atsuhiro Nagasaki	Industrialization of electrically charged alkaline phosphatase for mineralized tissue diseases
20	Tohoku University	Minoru Ishikawa	PROTACs for neurodegenerative diseases
21	National Institute of Technology, Nagaoka College	Shuji Kawakami	Realization of DX in the septic tank industry through BOD prediction technology and creation of a new organic matter recycling market by utilizing septic tank sludge
22	Nagaoka University of Technology	Akihiro Nakamura	Droplet Screening Service for the Bio-Manufacturing Sector

Step 1 Standard Category
 Step 1 Advanced Category
 Step 2 Standard Category
 Step 2 Advanced Category

23	Nagaoka University of Technology	Ryuta Harada	Development of aquaculture technology using novel feeding stimulants
24	Niigata University	Masashi Okamoto	Medical Image Measurement DX solution Development Proof-of-Concept for Cost and Operational Optimization -Fully Automated Spine,Pelvis,and Lower Limb Measurement Based on Deep Learning -
25	Niigata University	Shunji Natsuka	Development of a Glycan Profiling Database for Specific Diseases and Functional Foods
26	National Institute of Technology, Akita College	Koh-ichi Maruyama	A project to maintain and preserve laminated wood and other building materials for a long time without being discouraged by disasters, and to spread the local timber culture to the world, where the beauty of wood can be appreciated
27	National Institute of Technology, Akita College	Ming Zhao	Utilization of coral-shape palladium porous nanomaterial for the development of seawater electrolysis-H ₂ production system
28	Yamagata University	Kenshin Yoshida	Development of quantum dot films for the production of biofuels derived from microalgae
29	Miyagi University	Makoto Kanauchi	Development of an Enzymatic Production System for D-Amino Acids with Neuroactive Properties for Use as Functional Food Ingredients
30	Miyagi University	Motoko Morimoto	New Developments in Canine and Feline Cell Production and Evaluation Systems for New Drug Development in Veterinary Medicine
31	Tohoku University	Hinata Kariya	Developing a Novel Valve for Spacecraft to Accelerate Space Development and Validate its Commercialization
32	Tohoku University	Yasuhisa Hirata	Advanced Robotic Cushions for Optimal Posture and Safe, Independent Movement
33	Tohoku University	Takuro Matsumoto	AI-Powered Automated Slit-Lamp Microscope for Home-Visit Eye Care
34	Tohoku University	Yuya Kamano	Development of novel regenerative medicine using allogenic skeletal stem cell progenitors
35	Niigata University	Kazuhiro Hori	A Tongue Hygiene App with Image Recognition to Market
36	Tohoku University	Masahiro Yamada	inSituReg:Bio-Implant Driving Endogenous Regeneration
37	Tohoku University	kazutaka jin	Epilepsy-Specific Gene Panel and Drug-Selection Support AI
38	Tohoku University	Motoko Maekawa	Development of a Blood-Based Diagnostic Aid for Autism Using Lipid Biomarkers
39	Tohoku University	Takafumi Toyohara	Clinical translation of “living” vascular grafts
40	Tohoku University	Shinichi Sato	Novel Diagnostic Drug Development Business for Synucleinopathies Based on Aggregate Seed Detection
41	Niigata University	Susumu Sasaki	Extremely Early Diagnosis by Innovative MRI
42	Tohoku University	Yasuhiro Fukushima	HumiDAC : Energy Saving Carbon Capture from Air and Exhaust Gases
43	Tohoku University	Yasuko Tatewaki	Pioneering a New Market for Dementia Screenig through Amyloid MRI

Project Title

Business Viability of Utilizing Digital Archives of Local Resources

Summary of Seeds

Providing 3D data of "Authentic Japan".

The game and movie industries are increasingly interested in the "Authentic Japan". To reproduce the "Authentic Japan" requires real data, but it is inefficient to acquire real data on a case-by-case basis. On the other hand, there remain many local resources that are authentically Japanese, but they have not been archived due to economic challenges. This project will convert financially troubled local resources into digital data and provide the data to industries seeking the Authentic Japan.

C l i e n t

Targeting **Game and Film companies** interested in traditional Japanese content

P r o b l e m s

Game & Film industry

- Growing interest in Japanese culture
- Seeking "Authentic Japan"
- Difficulty in rights clearance

Provides cost and opportunity >>>

Bridging the two sides

<<< Provides Authentic Japanese data

Local Resources

- Insufficiently preserved, except for items of high historical value
- Records and investigations are not progressing.

S o l u t i o n

Acquiring 3D data on local resources and provide data

*Local resources: Cultural assets, folkloric resources, local performing arts, etc. in each region

Our previous research

Digitization of local resources has been implemented

- We have been researching digital archiving of local performing arts.
- Began studying methods of measurement and utilization of local cultural assets, etc.

Katsumi Sato

Graduate School of Education
Associate Professor

Project
Title

Creating a New Market for Disaster Education through Hero-Based Content and Developing a Sustainable Business Model

Summary of
Seeds

1. Provides an innovative educational experience where young children and their guardians can enjoy learning disaster preparedness through engaging hero-based content.
2. Delivers a hybrid disaster education program—optimized for preschools and kindergartens—combining online materials with interactive in-person activities.
3. Offers flexible, locally-tailored content that meets the specific disaster risks and needs of each community.
4. Promotes shared understanding and collective action by involving not only children, but also teachers and parents, thereby enhancing community-wide disaster resilience.
5. Ensures competitive differentiation through unique intellectual property and branded content that is difficult to replicate.

Project Title

Conservation, restoration and inheritance of art collections

Summary of Seeds

The goal is to create a new management infrastructure for contemporary art works based on the use of technology and data in the field of cultural property conservation and restoration. Compared to classical works, which are the main target of cultural property conservation, contemporary art works use completely different materials and techniques than classical works, making it difficult to deal with them using only the current conservation infrastructure. In addition, contemporary art works are, Since there are many private collections, we propose a B-to-C management infrastructure. The development of this project will help to diversify the methods of managing art collections and, in turn, help to ensure the safe management, purchase, and inheritance of artworks.

This is expected to change the mindset that tends to leave the management of art works to specialists, and promote a shift from being someone else's business to one's own business, leading to an increase in interest in culture as a whole.

Project
Title

Supporting Newly Nurse Training with Skill Visualization

Summary of
Seeds

Goals:

- ① Help new nurses visualize their own growth
- ② Enable managers to give better advice by tracking progress
- ③ Reduce reporting burden and improve workplace QOL

Benefits for Managers:

Use digital data to build an effective training system

Manager Challenges:

Hard to track individual nurse growth
No usable data for training support

New Nurse Challenges:

High demand for many accurate skills
Hard to recognize their own growth

Title

Breakthrough in Predicting Cancer Recurrence

Summary of
Seeds

CK2 α in the nucleolus as prognostic factor for future recurrence

We report here the IHC evaluation of protein kinase CK2 α (CSNK2A1) in nucleoli of invasive ductal carcinoma of the breast is strongly associated with tumor recurrence and poor outcomes ($p=0.0001$), in both triple-negative and luminal types. The method has been applied to lung adenocarcinomas ($p=0.0019$). In both cases, nucleolar CK2 α -positive staining can be suggested as an independent variable among multiple clinical-pathological factors that determine future length of recurrence-free survival. Our results suggest that evaluation of the nucleolus CK2 α -positive group may be a new and precise prognostic factor, contributing to companion diagnoses and early treatment efficacy. We validated the protocol for IHC-staining by using our monoclonal antibody against CK2 α which demonstrated high specificity and sensitivity for applications.

Detection of nuclear protein kinase CK2 α by IHC analysis of invasive ductal carcinomas of breast

Nucleolar CK2 α status as a precise, new, independent prognostic factor for recurrence-free survival

Coxproportional hazards regression/ Multivariate				
Factor	Wald	HR	95%-CI	P-value
CK2 α Nucleolus (+)	5.711	5.264	1.348-20.553	0.017

Title

**Development of Three-Dimensional Dosimetry Technology for
Standardization of Radiation Resistance Evaluation of Large Components**

Summary of
Seeds

In components used in radiation environments, it is essential to ensure radiation resistance with high precision. This is of particular importance for components used in spacecraft for space exploration and robots operating in nuclear reactors. Some of these components are large in size and require testing using large gamma irradiation facilities. However, in such cases, the components themselves cause gamma-ray shielding and scattering, making it difficult to obtain detailed information on gamma-ray resistance within the interior of the component.

Furthermore, it should be noted that radiation detectors tend to be expensive and are themselves subject to degradation caused by radiation. Consequently, in order to facilitate large-scale structure measurements, there is a necessity to develop low-cost sensors with high radiation resistance. The use of multiple sensors also increases system complexity, necessitating the development of software that enables simple and stable measurements.

In this study, we propose a system capable of low-cost, multi-point radiation measurement by employing radiation detection elements based on amorphous solar cells, which we have developed. This approach facilitates practical radiation measurements inside large structures during actual irradiation tests.

Project Title

Promoting Healthy Calf Development through Microbiota Improvement

Summary of Seeds

Antimicrobial resistance (AMR), driven by the excessive use of antibiotics in livestock production, has emerged as a global issue. Reducing antibiotic use in animal agriculture is strongly encouraged, and the development of alternative strategies is urgently needed.

We have demonstrated that fecal microbiota transplantation (FMT) from healthy donor calves effectively treat diarrhea in recipient calves without relying on antibiotics (***Microbiome***, 10: 31, 2022). Furthermore, we have elucidated the underlying mechanisms contributing to the therapeutic efficacy of FMT and proposed a roadmap for its implementation in livestock practice. To enable nationwide application, we have also developed a preservation method for donor-derived beneficial microbiota, which allows for long-term storage (***Scientific Reports***, 14: 28078, 2024). This ensures the effectiveness of microbiota transplantation even when donor and recipient calves originate from different regions. The cocktail composed of beneficial microbiota represents a novel concept not found in current veterinary pharmaceuticals, and its practical use will require appropriate regulatory frameworks. Additionally, to promote its widespread adoption, it is essential to understand the needs of livestock producers and clinical veterinary doctors. Therefore, this project aims to analyze those needs and to establish standardized production protocols for beneficial microbiota cocktails, ultimately facilitating their social implementation.

Project Title

Development of functional food for feline kidney disease containing a combination of lactoferrin and nicotinamide

Summary of Seeds

Creating a unique functional cat food with dual active ingredients, lactoferrin and nicotinamide, that helps prevent kidney disease.

Cause of death in old cats

Cats with kidney disease are one in four older cats, however, there are no effective preventive or therapeutic medications, and it is the leading **most common cause of death.**

The number of cats is increasing every year, and as cats are living longer, the prevalence of feline kidney disease is also increasing.

Pet owners need food that supports long-term health and prevents disease.

The market is expected to continue growing due to the increase in cat breeding both in Japan and overseas.

Project Title

Personalized DX for Independent Mobility in Gait Disorder

Summary of Seeds

Social issue

Roughly 300,000 people have strokes each year. Among them, **nearly half face daily living challenges, including local shopping**, due to gait disorders even after hospital discharge.

Challenges in Rehabilitation Settings

Gait disorders are complex, with causes varying by patient, involving both physical and cognitive functions. Thus, personalized treatment developed through repeated hypothesis-testing is essential.

However, a lack of medical manpower currently prevents this critical cycle from being fully realized.

Evaluation

Hypothesizing Gait Disorder Factors

Treatment

Verification of Treatment Efficacy

Solution

Automatic classification of gait impairment patterns by body part from video, providing personalized treatment.
Achieves high-quality, high-cycle evaluation and treatment.

Title

Feasibility study for the commercialization of a male infertility treatment system based on comprehensive trace element analysis

Summary of
Seeds

- The number of infertility treatments continues to rise, and in recent years, one in every 5.5 couples has undergone infertility treatment. This has raised concerns over increased social security costs and a decline in overall well-being due to the high cost of treatment.
- Decline in sperm function leads to reduced conception rates, but effective methods to address this issue have not yet been established.
- This proposal aims to apply comprehensive metal analysis “metallomics,” which allows for the simultaneous measurement of essential elements and toxic metals, to the resolution of male infertility.
- As a business model, metallomic analysis of semen will be conducted on a contract basis for clinics providing infertility treatment.
- By measuring and evaluating essential elements critical for sperm function—such as selenium and zinc—and toxic metals harmful to sperm—such as cadmium, lead, and mercury—revenue will be generated through the provision of these analytical results.
- We propose a business model in which supplements for deficient elements are offered, generating additional revenue by providing evidence-based reasoning for supplement intake and evaluating the effectiveness of supplementation.

Project Title

FABP-Targeted Therapeutics for the Treatment of Multiple Sclerosis

Summary of Seeds

- **Multiple Sclerosis (MS)** is characterized by inflammation caused by immune cells in the central nervous system (brain and spinal cord) and optic nerves, leading to the destruction of the myelin sheath that surrounds nerve cells.
- **Immunosuppressive drugs** have been developed to suppress abnormal immune responses. However, **existing treatments often cause side effects related to immune system suppression**. Therefore, **there is a strong need for the development of novel therapeutics based on alternative mechanisms of action**.
- Collaborative research by Dr. Koji Fukunaga has revealed that **fatty acid binding proteins (FABPs)** are involved in the destruction of the myelin sheath.
- This study aims to **develop therapeutic agents targeting FABPs** for the treatment of multiple sclerosis.

課題名

Industrialization of electrically charged alkaline phosphatase for mineralized tissue diseases

シーズ概要

【Background】

Recently, the number of patients with mineralized tissue diseases such as periodontitis and osteoporosis has been increasing rapidly in the world. The incidence rate of both diseases is very high, and the number of patients is expected to increase in the future. Thus, the development of effective treatments is needed urgently. However, there are problems such as the fact that lesions have a rich blood flow and tissue fluid contamination, making it difficult to effectively act locally.

【Solution】

This study focuses on tissue non-specific alkaline phosphatase (TNAP), which strongly promotes calcification, and by genetically adding amino acid residues to make it negatively charged. TNAP promotes mineralization efficiently and effectively against positively charged mineralized tissues.

【Specific initiatives】

We have been developing this molecule, which can be a drug discovery target, with evaluating the therapeutic effects of TNAP on mineralized tissue diseases and their mechanism *in vivo* and *in vitro*.

Project
Title

Realization of DX in the septic tank industry through BOD prediction technology and creation of a new organic matter recycling market by utilizing septic tank sludge

Summary of
Seeds

- Currently, maintenance of septic tanks is handled by inspectors visiting the site. To solve this problem, we aim to develop a tool that can immediately predict treated water BOD on site. Specifically, a BOD prediction model will be constructed by deep learning using supervised data that links images of septic tank water surface and treated water BOD. Ultimately, the project aims to realize DX in the septic tank industry using BOD prediction technology to solve the shortage of human resources in septic tank technology, and to establish an organic sludge trading platform to create a new organic recycling market through the use of septic tank sludge.

Project
Title

Droplet Screening Service for the Bio-Manufacturing Sector

Summary of
Seeds

Bio-manufacturing is anticipated as a dual-benefit innovation that addresses global societal challenges—such as food and resource shortages and environmental pollution—while simultaneously driving economic growth. In other words, the bio-manufacturing sector is expected to expand not only within existing bio-related industries but also through the entry of new ventures aiming to solve social issues. However, the discovery and improvement (i.e., breeding) of microorganisms (cells) essential for the production of bio-based products remains a major bottleneck. These processes require specialized expertise, significant time, effort, and financial investment, posing high business risks for companies attempting in-house development. This proposal aims to commercialize an ultra-efficient droplet-based screening technology to offer exploration and strain improvement services. By doing so, we provide our clients with a powerful solution to dramatically shorten the development timeline in bio-manufacturing.

A project to maintain and preserve laminated wood and other building materials for a long time without being discouraged by disasters, and to spread the local timber culture to the world, where the beauty of wood can be appreciated

Summary of Seeds

- We will develop a **disaster prevention business** by standardizing the maintenance and conservation of laminated wood and other building materials for construction and other special purposes such as civil engineering and the owners of their facilities, as soon as possible, by standardizing the maintenance and conservation of laminated wood and other building materials using a **monitoring system**, as well as a **new repair and maintenance eco-business** for repairable decay and damage.
- The **deep technology** to predict wood damage and loss will create various values by combining the seeds of academia, such as constant stress monitoring and AI technology, with the **comprehensive knowledge** of industry, such as business infrastructure.
- From the viewpoint of disaster prevention, local governments have already expressed expectations and interest in technologies related to maintenance and preservation to manufacturing, delivery, and construction companies, and these requests are expected in the future. In addition to responding to these requests, the project aims to contribute to the **"inheritance of local timber culture"** and the **"spread of safe and secure wooden construction"** without compromising the aesthetic and cultural value of timber.
- First, we will target the facilities constructed in **Akita Prefecture**, and then develop a strategy for expansion into the **domestic market**, such as areas that are expected to be affected by the disaster, as well as the **international market**.

Project Title

Utilization of coral-shape palladium porous nanomaterial for the development of seawater electrolysis-H₂ production system

Summary of Seeds

Development of efficient and stable electrode materials for water electrolysis to produce clean H₂ is crucial for a carbon neutral society. To this end, we developed a simple fabrication method for coral-shape mesoporous Pd nanomaterial (Pd NC) with a ligament size of around 4.1 nm, an average pore size of 28 nm, and a high surface area of 110 cm²/g. The preparation was carried out by simple solvothermal reduction at a mild temperature, without using any templates.

In alkaline water electrolysis, the Pd NC outperforms the traditional Pd nanoparticles and the state-of-the-art Pt (under large potentials) for H₂ evolution reaction. Compared with Pd nanoparticles, the production amount of H₂ increased by 2.4 times at a potential of 0.4 volts, and the utilization efficiency of Pd was improved by 1.8 times (i.e., about 44% of material cost was saved) by using Pd NC as the electrode material. Moreover, Pd NC showed a long-term stability during the electrolysis in an alkaline medium and less than 5% of current loss was observed.

Project
Title

Development of quantum dot films for the production of biofuels derived from microalgae

Summary of
Seeds

The widespread adoption of biofuels derived from microalgae is expected to contribute to the realization of a carbon-neutral society. However, this effort faces challenges due to the high cost of fuel, which stems from limited cultivation yields and restricted cultivation sites.

To address these issues, we have developed a light-wavelength conversion film that utilizes perovskite quantum dots as wavelength-converting materials, enabling low-cost and efficient outdoor cultivation using sunlight. Furthermore, by combining this technology with a closed-loop cultivation system namely, a photobioreactor that is less affected by weather conditions we aim to expand the cultivation area. This integrated approach will enable both high-efficiency cultivation of microalgae and the expansion of viable cultivation sites, thereby contributing to the production of low-cost biofuels.

Development of an Enzymatic Production System for D-Amino Acids with Neuroactive Properties for Use as Functional Food Ingredients

シーズ概要

- The aim of the project to develop innovative food products containing D-amino acids as D-serine, which are expected to maintain and activate brain supporting cognitive functions in the elderly.
- The existing D-serine synthesis method, D-serine is produced by chemical synthesis method using toxic heavy metals as catalysts.
- On the other hand, it was developed a new method for measuring D-serine production. Consequently, it was found a fermentation method using lactic acid bacteria strain H74 with D-serine conversion ability (Patent Application 2023-094516, Makoto Kanauchi and Hinako Kato, 'D-serine production method', Public University Corporation of Miyagi University).
- Therefore, a new technology for the production of D-serine has been developed to enable the enzyme to function by immobilizing the D-serine converting enzyme derived from the Lactococcus lactis H74 strain. Consequently, the D-serine produced by this biocatalytic method provides functional food for the elderly to maintain and improve cognitive functions

D-Serine, which is produced in the human body, regulates synaptic transmission in the brain.

Problem 1 : D-serine is scarce in nature.
Problem 2 : Edible D-serine is not available on the market.

- Chemical synthesis of D-serine:** This method may result in contamination with heavy metals used during the process.
- Extraction of D-serine from plant or animal sources:** This method is inefficient and costly.

Title

**Advanced Robotic Cushions for Optimal Posture
and Safe, Independent Movement**

Summary of
Seeds

- **Problem to be Solved:** Mobility-assistive welfare devices and robots, once fitted to a user's physical abilities and environment, are rarely readjusted, leading to risks of poor posture and falls.
- **Value Proposition: Posture Support with Adaptive Robotic Cushions**
 - **Cushion with Adjustable Softness and Hardness:** We are developing a "Robotic Cushion" whose shape and stiffness change according to the user's physical abilities and environment, significantly reducing poor posture and fall risks.
 - **High Versatility:** We provide a highly versatile solution designed to be shareable across various types of welfare devices and robots, enabling utilization in diverse situations.
 - **Lifelogging:** By integrating heart rate/body pressure sensors, the system enables daily status monitoring and anomaly detection.

Project
Title

AI-Powered Automated Slit-Lamp Microscope for Home-Visit Eye Care

Summary of
Seeds

<<AI device that lets home-visit doctors
—who normally struggle with eye care—provide full ophthalmic exams>>

○ Slit lamp + Ophthalmologist's Expertise
= **Our Core Technology**

○ The Value of This Core Technology for Elderly Patients
in Nursing Facilities and Home Settings

We turned a slit-lamp — essential for eye exams — into a portable device.

With AI, it **automatically scans, detects abnormalities, and provides a diagnosis.**

Traditional Eye Clinic Visit – ≈ **3 hours**
Travel → Waiting & Check-in → Exam
→ More Waiting → Payment → Pharmacy → Home

With Home-Visit Service – ≈ **10 minutes**
Exam → Doctor Review → Done

Utilizing this technology in home medical practice significantly alleviates the burden of ophthalmic care for elderly patients.

Project
Title

Development of novel regenerative medicine using allogenic skeletal stem cell progenitors

Summary of
Seeds

The development of innovative bone regeneration technology has the potential to preserve teeth that cannot be left behind and to facilitate the construction of the necessary bone.

Hospital Endodontics
Senior Assistant Professor

Project
Title

A Tongue Hygiene App with Image Recognition to Market

Summary of
Seeds

A tongue assessment system using a smartphone application with image recognition technology for anyone, anytime, anywhere.

Challenges

Lack of simple and quantitative tools to assess tongue hygiene.

Unique Value

- Provides immediate, user-independent, and detailed results.
- Enables longitudinal assessment through data storage.
- Offers simple visual feedback and cleaning methods.

< Target Stakeholders >

Oral Healthcare Manufacturers

Product and promote new development

Dental Clinics & Care Facilities

Effective and continuous oral care management

Universities & Research Institutions

Reliable data collection for large-scale studies

< End Users >

Older adults & general population

Assessment and motivation for oral self-care

Dental professionals & care staff

Professional oral care and assessment

Researchers

Quantitative assessment of oral condition

Project Title

inSituReg: Bio-Implant Driving Endogenous Regeneration

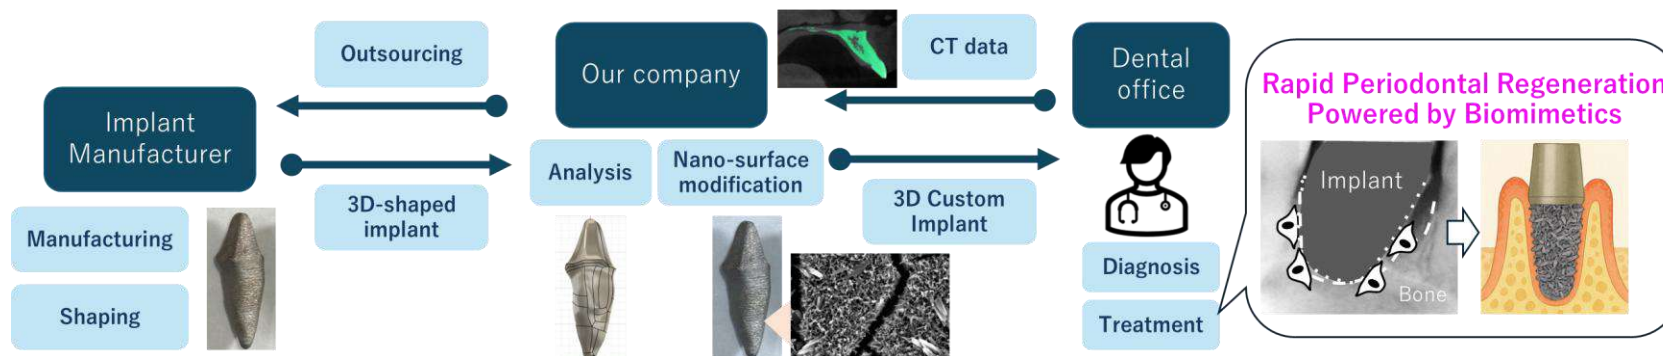

Summary of Seeds

We are developing a next-generation “**Bio-Implant**” that regenerates periodontal ligament simply by placement after tooth extraction.

Using patient-specific CT data, we create custom implants featuring proprietary **nano-surface modifications** to activate endogenous stem cells. This biomimetic, cell-free strategy enables minimally invasive and simplified surgery.

Our B2B2C model—contract manufacturing, nano-processing, and dental clinic distribution—fits seamlessly into existing workflows. Targeting new markets such as younger patients and the elderly, we aim for global growth through strategic partnerships and early exit via M&A.

From CT Scan to Chairside Delivery : A B2B2C Solution for Universal Smiles

Project Title

Epilepsy-Specific Gene Panel and Drug-Selection Support AI

Summary of Seeds

- Epilepsy affects 1 in 100 people, and about 30% of cases are drug-resistant.
- In drug-resistant epilepsy, there are no clear guidelines for selecting medications, and finding the right regimen can take years to decades.
- In this project, we use a gene panel analyzing over 1,000 epilepsy-related genes together with AI to recommend optimal drugs and reduce seizures in patients.

Project Title

Development of a Blood-Based Diagnostic Aid for Autism Using Lipid Biomarkers

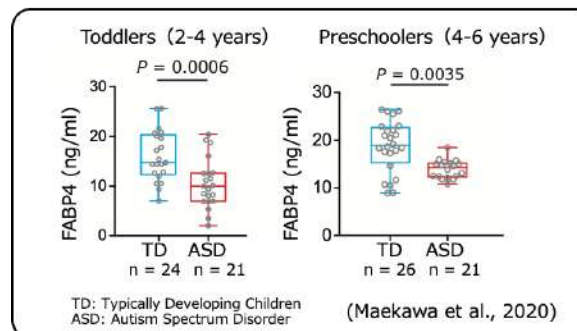

Summary of Seeds

This project proposes the development of a diagnostic aid for autism spectrum disorder (ASD) using the lipid-related biomarker FABP4 (Fatty Acid Binding Protein 4), which we have identified through our research. The aim is to develop a blood-based test kit utilizing this technology and to explore its commercialization potential. The key feature of this method lies in its ability to provide objective diagnostic indicators through blood sampling, which may complement existing diagnostic approaches. In parallel, we are also exploring FABP4-related drug discovery seeds. In the future, we envision building an integrated support model that links diagnosis and treatment for individuals with ASD.

Integrating Blood Biomarkers into Autism Diagnostic Process

Decreased FABP4 in the Serum of Young Children with ASD

- FABP4 is an adipocyte-derived protein.
 - FABP4 may be involved in normal brain development.
- (Kirikae et al., 2025; Sun et al., 2025)

Project
Title

Clinical translation of 'living' vascular grafts

Summary of
Seeds

Atherosclerosis, the leading cause of stenosis and occlusion in major arteries, results in life-threatening ischemic conditions such as coronary artery disease and stroke. Current treatments, including vascular interventions and bypass surgery, often encounter restenosis—a recurrence of artery narrowing—highlighting the urgent need for more effective therapies.

Our groundbreaking approach leverages regenerative medicine, where damaged blood vessels are replaced with new, healthy ones. We have pioneered a revolutionary therapy using 3D blood vessels created from human induced pluripotent stem cells (iPSCs). These iPSC-derived blood vessels are not only structurally similar to human blood vessels but also function in a comparable way—a world-first achievement.

Our innovative therapy targets a broad range of atherosclerosis-related conditions, with an initial focus on Lower Extremity Arterial Disease. This breakthrough therapy has the potential to dramatically improve quality of life and promote healthy aging on a global scale.

Project Title

**Novel Diagnostic Drug Development Business for Synucleinopathies
Based on Aggregate Seed Detection**

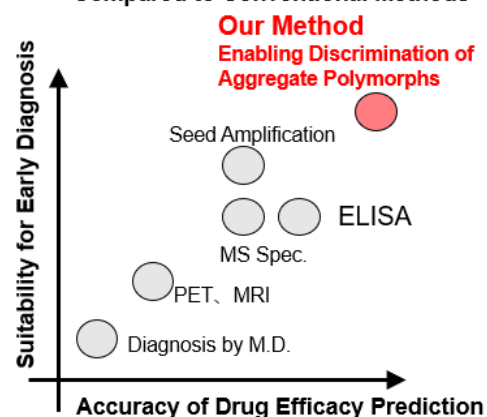

Summary of Seeds

- Small molecule probes that selectively form covalent bonds with protein aggregates
- Develop the first method that not only quantifies aggregate seeds in subjects' blood but also identifies aggregate polymorphic structures
- Develop diagnostic drugs that enable early disease diagnosis and prediction of efficacy for future therapeutic drugs by utilizing proprietary protein chemical modification technology for analyzing aggregate seeds

Project
Title

Extremely Early Diagnosis by Innovative MRI

Summary of
Seeds

- Contrast can be emerged from monotone images.
- The contrast comes from the difference in viscosities in organs (including brain) , blood or lymph fluid.
- The viscosities range from very low stage (smooth liquid) to sticky, gel and solid state.

This means that our innovative MRI enables us to detect various diseases, particularly cancer and malfunctions in the brain or in the blood vessels.

Project
Title

HumiDAC: Energy Saving Carbon Capture from Air and Exhaust Gases

Summary of
Seeds

Issue

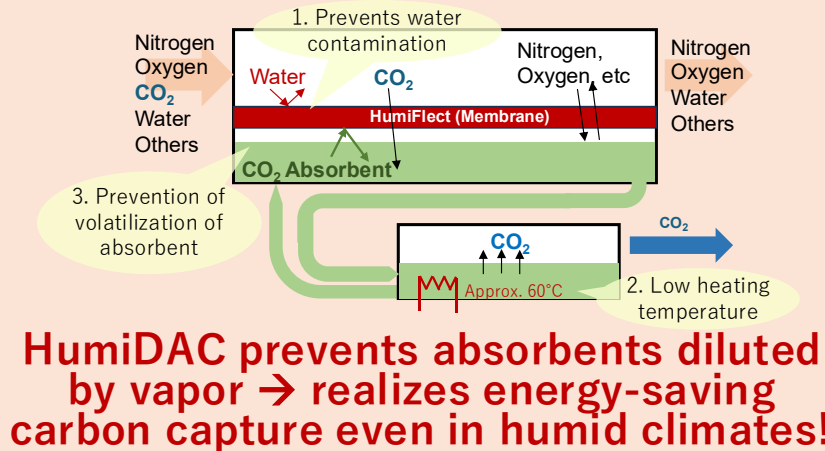

To realize a carbon-neutral society, all manufacturers must **use non-fossil carbon resources** or **purchase credits created by CO₂ storage**

Existing carbon capture technologies consume excessive amounts of energy!

Especially in humid climates

Solution

Products

1. Module Type

Supply plant engineering companies with various types of HumiDAC modules for use in their large scale process

2. Unit Type

Assuming a company deploys HumiDAC at a commercial level (20or40 foot container with stacked HumiFlect membranes)

Business Model

Estimated customers

1. Chmicals producers who want to **secure their green carbon sources**
2. Companies who wants to **sell carbon dioxide or create carbon storage credits**

all range of scales at all different kinds of locations will be our target

Project Title

Pioneering a New Market for Dementia Screening through Amyloid MRI

Summary of Seeds

This innovative technology enables the visualization of amyloid- β ($A\beta$) accumulation associated with Alzheimer's disease using standard MRI systems.

As a cost-effective and scalable alternative to amyloid PET—which remains invasive, expensive, and limited in availability—this technology offers significant value to key stakeholders:

- **Brain Health Screening (Brain Dock):**

A safe, accessible solution for early dementia risk detection.

- **Pharmaceutical Companies:**

Streamlined screening and substantial cost savings in clinical trial subject selection.

- **Hospitals:**

Seamless integration into routine clinical workflows using existing MRI infrastructures.

By leveraging a cloud-based SaaS model, the system ensures nationwide accessibility and rapid deployment.

With the global rise in dementia cases, demand for this technology is expected to grow.

We aim to achieve ¥230 billion (approximately \$1.5 billion USD) in revenue within five years.
